### **THE MAJOR:**

Biology, the study of life's basis and processes, is a dynamic and rapidly expanding field. In one direction, the study of molecular origins is the basis for understanding how cells are constructed, and how they function (including metabolism,, growth, development and reproduction.) In another direction, organisms are studied in order to understand how populations or organisms interact among themselves and their environment. The wider range of sub-divisions in this field does not lessen the fact that, in all of them, some aspect of living material is the prime focus. Since life activity is dependent upon the chemical release of energy within the organism, Chemistry continually enters biological experiments/interpretations. The principles of Mathematics and Physics also underlie most biology.

### **CAREER FIELDS:**

Biochemist	Environmentalist	Med. Technologist	Physical Therapist
Biologist	Forester	Oceanographer	Physician
Biomed. Engineer	Laboratory Assistant	Optometrist	Physical Therapist
Biophysicist	Lawyer	Osteopath	Psychologist
